

The Felins Flex Strap Tandem stretch film bundling system provides cost saving benefits through increased production. Unsecured bundle stacks can be presented to and through the banding process more quickly than a belt conveyor system.

This system integrates 2 XL-110s to operate together from a single foot trip activation. Integrated product presence sensors on each machine allows machines to apply bands simultaneously, or individually. The product presence sensors allows each machine to band only if product is detected.

This base system comes complete with 2 integrated Flex Strap XL-110 stretch film banding machines. Gravity Infeed, intermediate and exit conveyors can be ordered fit for purpose based on common product lengths and bands spacing requirements.

Specifications: 110V, 1PH, 20A each machine
