

AUTOMATION SYSTEM OPTIONS

Our automated equipment is specifically designed to effectively transport difficult to handle, unstable bundles of laundry. Combined with conveyance, transfer systems and our proprietary Traffic Control Master (TCM), our complete laundry management systems can efficiently move stacks from a folder or stacker through to pack-out without operator assistance.

CONVEYORS

We offer a full line of conveyors build specifically for laundry.

- Belted curve conveyors
- Intelligent accumulation conveyors
- Lift gate conveyors for operator movement
- Incline conveyors
- Mainline conveyors

TRANSFER SYSTEMS

We can direct your bundles! We use a variety of solutions to divert bundles to the proper area of your facility:

- Diverters
- Production identification units
- Corner pushers
- RFID integration

TRAFFIC CONTROL MASTER (TCM)

Anyone can put stock conveyors into your facility but only Felins can integrate everything into a complete transport system and regulate it with our TCM.

Designed for continuous workflow, the TCM manages all bundles from any type of discharge and stacker. By automatically merging bundles from the discharge unit onto the main line conveyor, the TCM maintains appropriate bundle spacing, orientation and stability to prevent crashing and rework.
